

# Vulnerability Assessment Report

1<sup>st</sup> January 20XX

---

## System Description

The server hardware consists of a powerful CPU processor and 128GB of memory. It runs on the latest version of Linux operating system and hosts a MySQL database management system. It is configured with a stable network connection using IPv4 addresses and interacts with other servers on the network. Security measures include SSL/TLS encrypted connections.

## Scope

The scope of this vulnerability assessment relates to the current access controls of the system. The assessment will cover a period of three months, from June 20XX to August 20XX. [NIST SP 800-30 Rev. 1](#) is used to guide the risk analysis of the information system.

## Purpose

Consider the following questions to help you write:

- *How is the database server valuable to the business?*
- *Why is it important for the business to secure the data on the server?*
- *How might the server impact the business if it were disabled?*

The database is invaluable to the business as it centralizes customer data, facilitates efficient operations, and empowers data-driven decision-making for enhanced competitiveness. Securing the system is crucial due to its pivotal role in marketing operations, while also protecting sensitive information, maintaining customer trust, adhering to regulations, and preventing potential financial and reputational damages.

## Risk Assessment

Threat source	Threat event	Likelihood	Severity	Risk
Competitor	Obtain sensitive information via exfiltration	1	3	3
Hacker	Delete or change critical information	3	3	9

<i>Employee</i>	<i>Disrupt business continuity</i>	<i>2</i>	<i>3</i>	<i>6</i>
-----------------	------------------------------------	----------	----------	----------

## **Approach**

Risks considered the data storage and management methods of the business. The likelihood of a threat occurrence and the impact of these potential events were weighed against the risks to day-to-day operational needs.

## **Remediation Strategy**

Implementation of authentication, authorization, and auditing mechanisms to ensure that only authorized users access the database server. This includes using strong passwords, role-based access controls, and multi-factor authentication to limit user privileges. Encryption of data in motion using TLS instead of SSL. IP allow-listing to corporate offices to prevent random users from the internet from connecting to the database.
